

M3: Creating and Populating Zagi Database

Group Assignment Guidelines

Part 1

Implement the database by creating all the tables. It is up to your team if you want to use the functionality provided by MySQL Workbench or if you want to write the commands. The EER will guide you on the data types. Add the necessary primary keys.

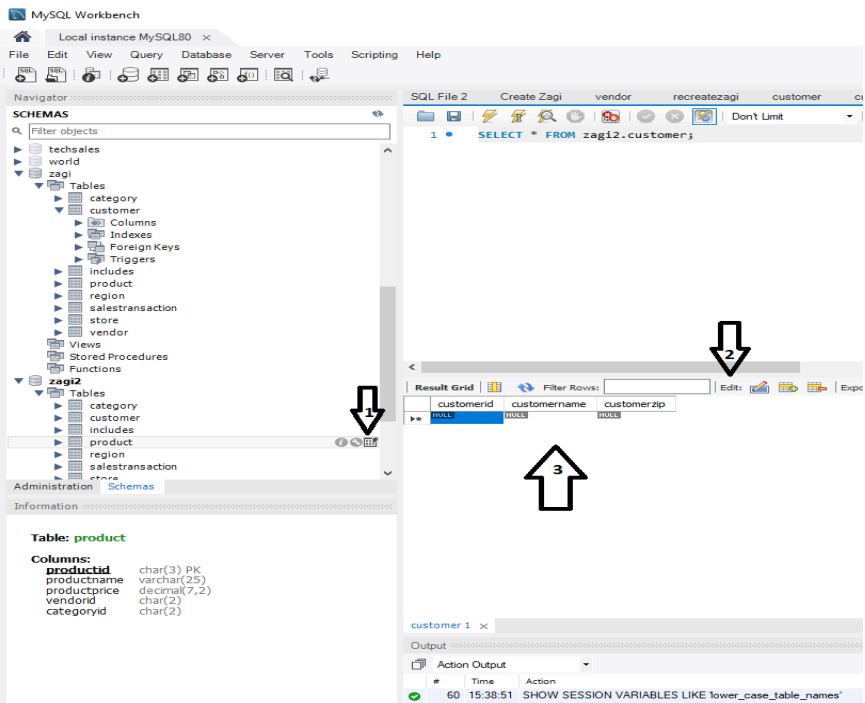

You may want to conduct some of the steps individually—and compare notes with your teammates.

Part 2

You and your teammates will try the following ways to add data to the tables. Please note that the screenshots provided are labeled as zagi2 (I did this as not to duplicate my existing zagi schema).

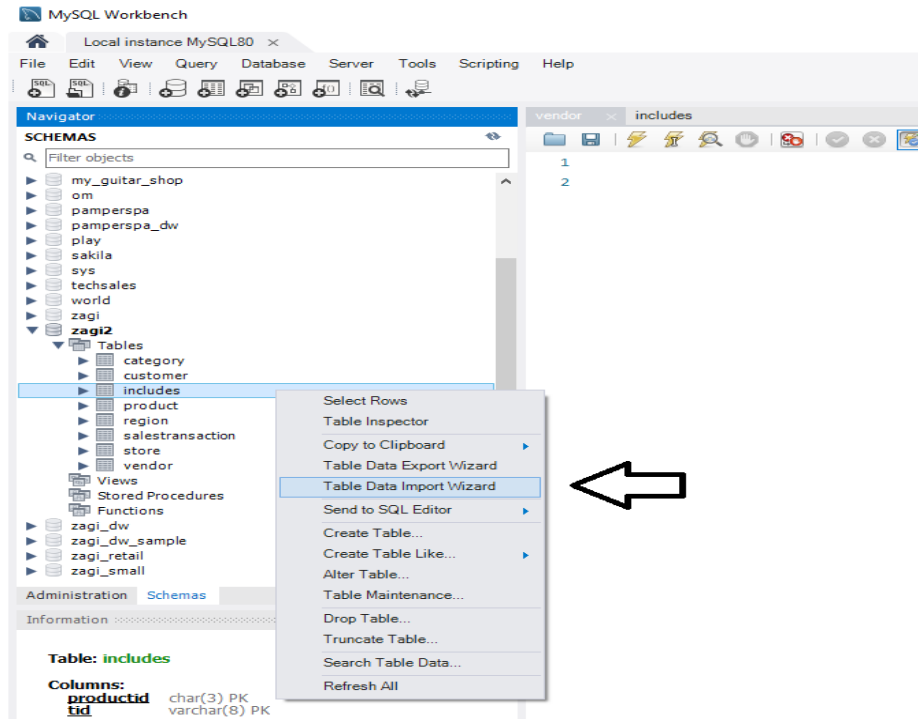

Yours should be labeled as zagi.

Table	Data Insert Procedure
category	Write an insert statement to insert the following values: • CP Camping • FW Footwear
customer	Use the MySQL Workbench Interface to add the following three rows: • 1-2-333, Tina, 60137 • 2-3-444, Tony, 60611 • 3-4-555, Pam, 35401 • 4-5-666, Carmen, 33160 Hover over the customer table and select the last icon (arrow 1 in the following annotated image). Select edit (arrow 2). Enter the data in the bottom right (arrow 3). Hit apply in the bottom right/apply/finish. 

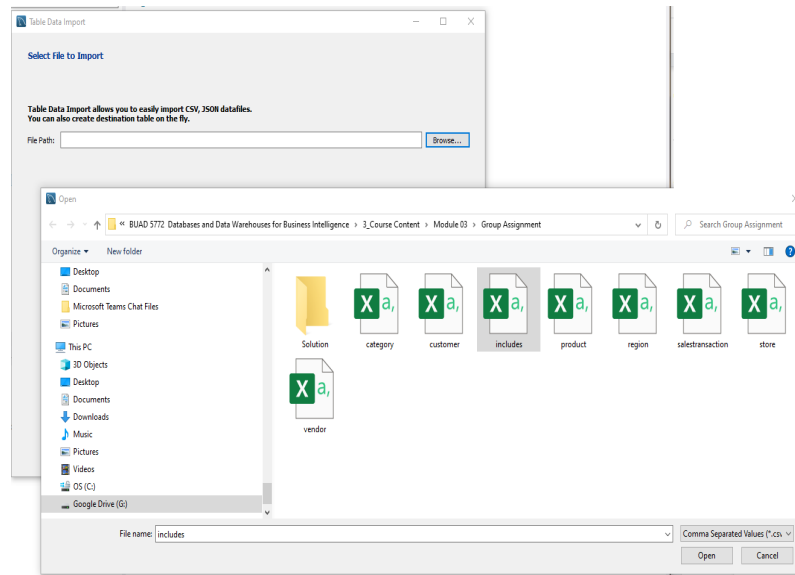

includes

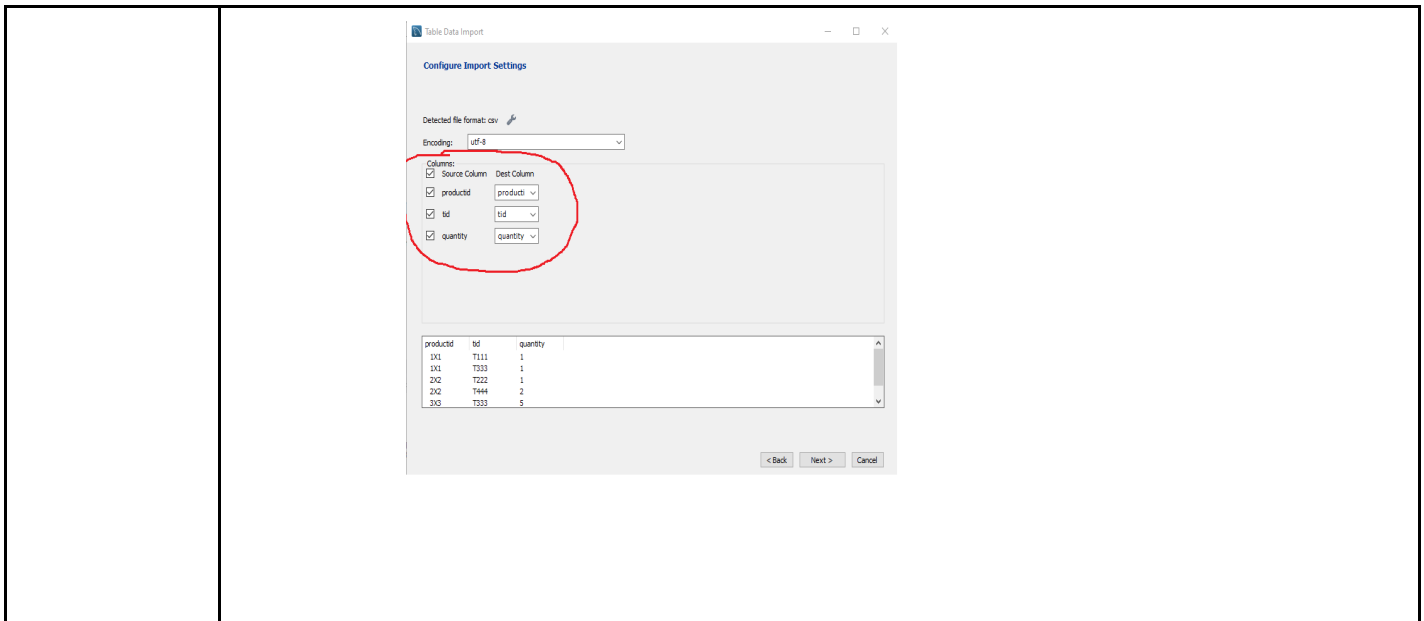

Hover over includes and select “Table Data Import Wizard.”

Find file with data for includes.

Open. Next, select use existing table. Ensure the fields map correctly (as shown in the following screenshot). Click next/next/finish. You should upload nine rows.

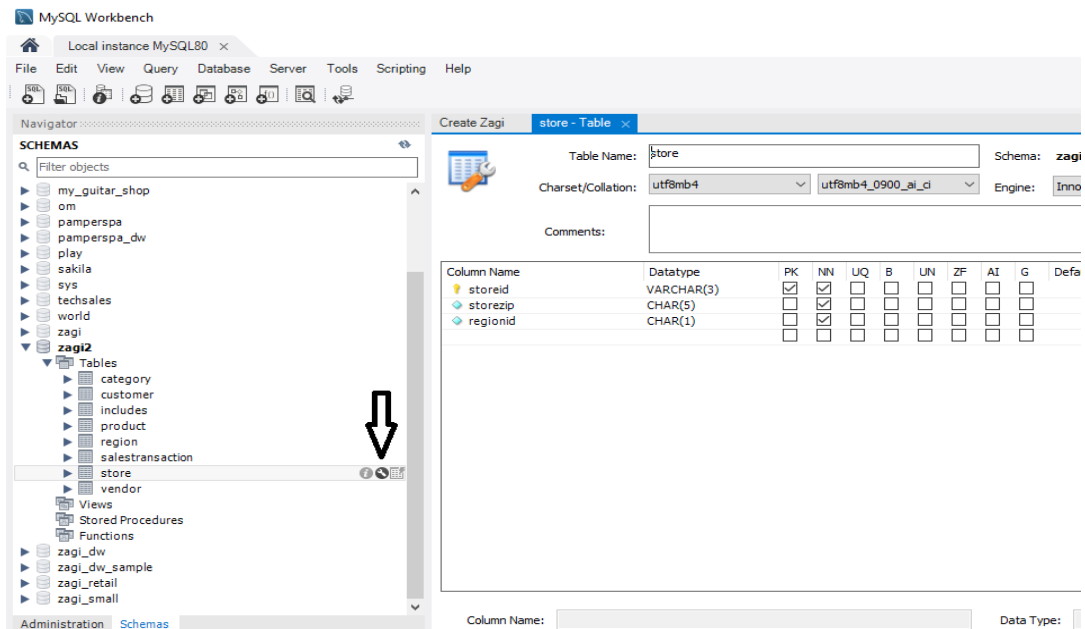

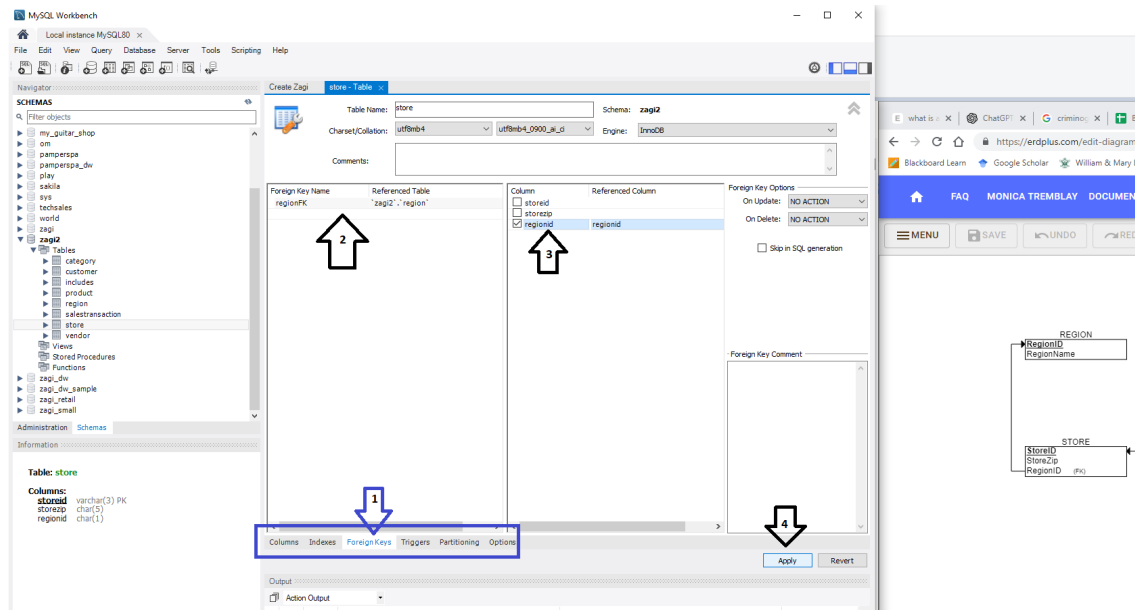

Use import wizard for the rest of the tables.

Part 3

Add the foreign keys. Identify which tables need foreign keys.

Method 1: Select the wrench when hovering over the table.

1. Select the foreign keys tab.
2. Type in a foreign key name (this name is up to you, only DBA will see it).
3. Map the foreign key to the referent key.
4. Hit apply/apply finish.

Method 2: Manually writing an SQL command, such as:

- ALTER TABLE store
- ADD CONSTRAINT regionFK
- FOREIGN KEY (regionid)
- REFERENCES region(regionid);

Part 4

Once you are confident that all your tables are properly created and contain data and the correct primary and foreign keys, extract the database to one file as shown in the assignment page video.

Part 5

Write the following queries:

1. Write a query that returns all the products that contain the word 'boot'.
2. Write a query that returns all vendor names that contain the letters 'tain' - use REGEXP.
3. Write a query that lists all customer names that begin with the letter T.
4. Write a query that lists all tid for where quantity is not null (use includes table).
5. Write a query that updates the customer table for customer '4-5-666' and changes the zip code to '34685'.
6. Write a query that deletes customer '4-5-666'.
