

Pineview Sales and Service Database

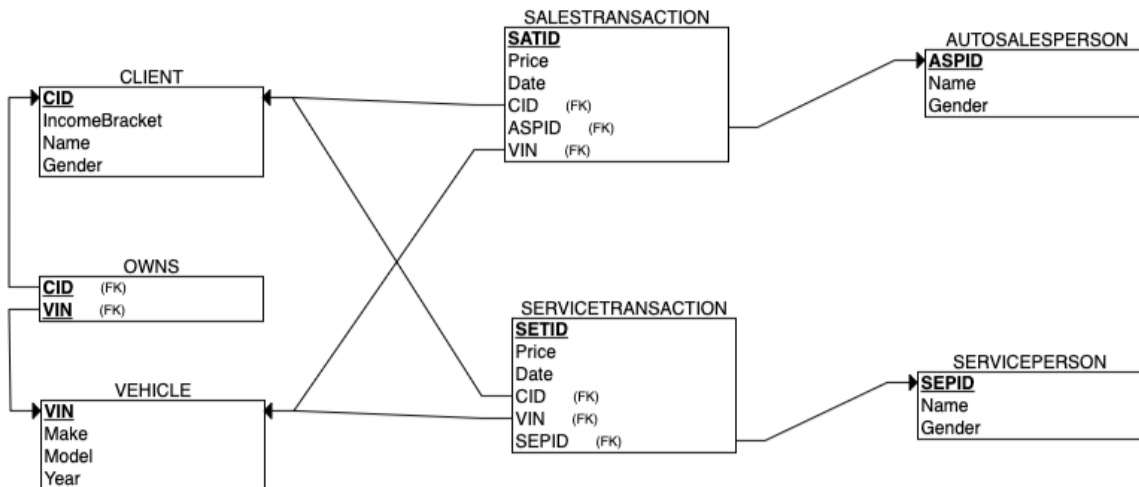

Consider the following scenario involving Pineview Ford, an auto dealership. Auto dealership Pineview Ford is organized as follows:

- Pineview Ford keeps track of Vehicle Identification number of every vehicle that is for sale, sold, serviced, or rented by the dealership.
- Vehicles are sold via a sale transaction. One transaction involves one sales person, one client, and one vehicle.
- Vehicles are serviced via a service transaction. One transaction involves one service person, one client, and one vehicle.
- In addition to selling and servicing vehicles, Pineview Ford occasionally rents vehicles. One rental transaction involves one rental agent, one client, and one vehicle.

Pineview Ford wants to create the analytical database (data warehouse) to analyze their revenue. The two available data sources, Source 1 and Source 2, are described below.

Source 1 Pineview Sales and Service Database, shown below:

CLIENT

CID	IncomeBracket	Name	Gender

RE1	333	C3	Female	2020-01-03	40	R11	Joe	Male

Instructions

The data warehouse has to enable an analysis of revenue by all relevant dimensions. (Hint, the dimensions should enable analysis by dates, vehicles, employees, clients, and types of revenue.)

Based on the sources and requirements listed above, create a dimensional model that will be used for the dimensionally modeled data warehouse for Pineview Ford. Use ERDPlus to illustrate the star schema, showing the fact table and the appropriate dimensions and the corresponding attributes.

Using data provided above, illustrate how the tables in the dimensional model you created would be populated. Create all possible sample rows for each table (using the data provided).

Submission Guidelines

- Open your Word document and place your name at the top of the document.
- Paste the diagram from ERDPlus into the Word document and create a table for each table in your star schema. Be sure to add rows for each table.
- Submit your Word document.
